Aim to be Urinary Tract Imbalance (UTI) Free

What about other products?

Independent international guidelines are a great source of information for healthcare professionals and consumers.

Cochrane Review and National Institute for Health and Care Excellence (NICE) Guideline information is provided below.

Antibiotics

Antibiotics are important for the treatment of certain bladder and urinary tract conditions. If prescribed by your health care professional take antibiotics as recommended. Frequent and incorrect use of antibiotics leads to antibiotic resistance.

Urinary Alkalisers (such as Ural®)

Urinary alkalisers are specifically NOT recommended for the management of urinary tract infections (UTIs). There is no quality evidence urinary alkalisers are effective in relieving symptoms.

Methenamine Hippurate (such as Hiprex®)

Methenamine hippurate acts to create cytotoxic formaldehyde within the bladder. A Cochrane Review of methenamine hippurate stated the product may be effective, particularly for short term prophylaxis, for a period of one week or less.

Cranberry products

Cranberry products are specifically NOT recommended for the management or prevention of urinary tract infections (UTIs). A 2013 Cochrane review does not recommend Cranberry containing products as they are not effective.
